

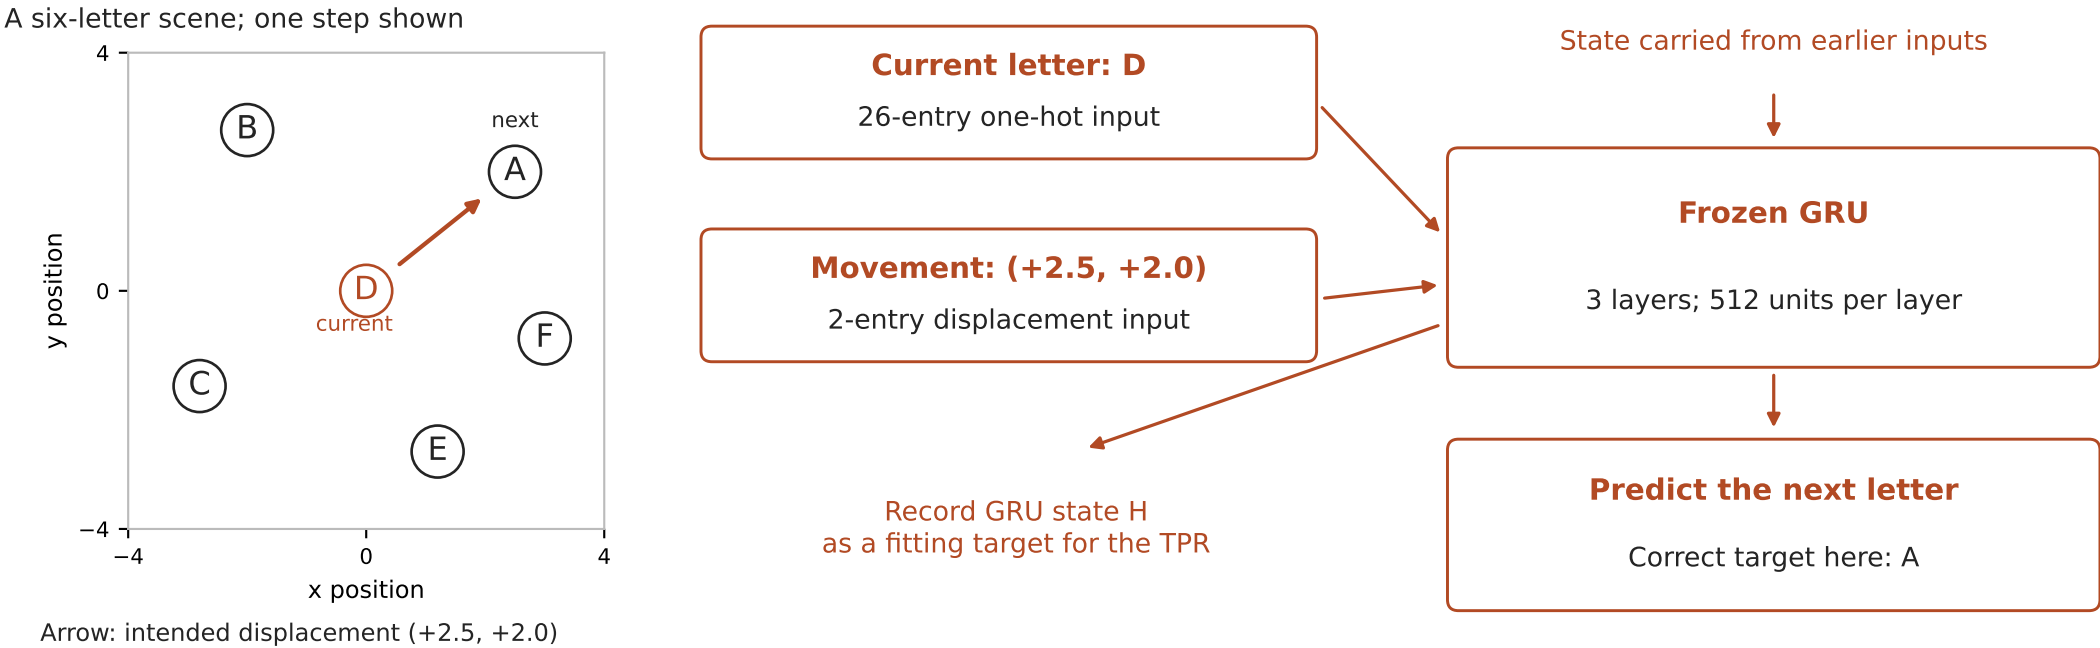

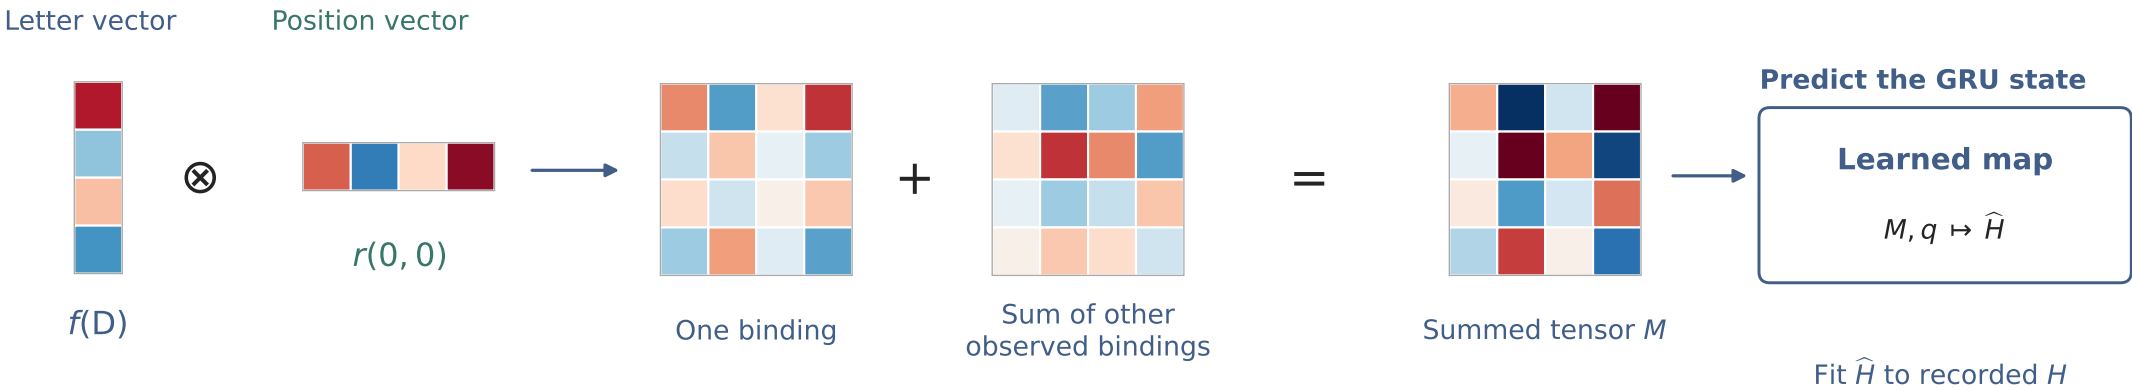

Figure 1. The scene, its predictive GRU, and a TPR model of the GRU state

A The GRU predicts observations in the scene

The map is shown for the reader. The GRU receives only the current letter and displacement; A is scored before it is supplied.

B The TPR approximates the GRU state for an observed history

One term per observed location; repeated visits are counted once. Context q describes the current input and movement.

Tiles illustrate signed feature values (blue negative, red positive), not fitted data; actual bindings are 26×16 .

Original schematic: scene task after Ventura et al. (2026), Fig. 1B; TPR construction after McCoy et al. (2026), Fig. 2.1.
